Introduction
Adirondack Hall is divided into three main areas: The prehistoric wilderness, the wilderness ca. 1800–1900, and the contemporary wilderness ca. 1900–present. Each area stresses the relationship between people and the Adirondack mountains; from the early American hunter, to the 19th century miner and logger, to the early 20th century traveler.
Exhibit Goals

Through animal and human life groups, artifacts, photographs, music, video, and our mineral gallery visitors will view the abundant resources of New York’s Adirondack mountains, and see the effects humans and these resources have had upon each other.

*Words marked with an * have definitions found in the glossary near the end of this guide.*

As you exit Adirondack Art, continue straight then turn sharply to your left to view Success Stories.

Loon, falcon, bald eagle, fisher*, American marten*. Think about the lost species you saw in the beginning of your hike. The species shown here we call success stories. Why?

MST 4 The Living Environment 7
Skills Goals

Students visiting the exhibit may:

- Identify the many resources found in the Adirondacks.
- Understand positive and negative human effects upon animal, plant and mineral natural resources that exist in the Adirondacks.
- View minerals, many still on the matrix* in their natural state.
- See the Adirondacks as both a place to work and play.

Content Goals

- Show impact humans can have on the environment and resources.
- Present a sampling of natural resources in the Adirondacks.
- Give examples of how important the Adirondacks have been and continue to be to New York State.
- Current, recovering and lost species of the Adirondacks.

Suggested Activities

PRE-VISIT ACTIVITY

With adjustments for Elementary, Intermediate and Commencement level learners.

Skills Goals

- Prepare for a compare and contrast of technology used in the Adirondacks 100 years ago versus today.
- Research the technology needs of Adirondack related activities and industry.

Content Goals

- Technology change.
- Compare and contrast.

Learning Standards

- MST 5.5 Technology
- MST 6.5 Patterns of Change
- MST 1 Scientific Inquiry
- ELA 1 Information and Understanding
- ELA 3 Critical Analysis and Evaluation

This activity will prepare students for the various technologies of the late 19th and early 20th centuries they will see during their visit.

Encouraging students to keep in mind needs like equipment, transportation, safety, health, food, and shelter ask them to make a list of supplies and technology they might need today to do any of the following:

- Hike
- Camp
- Cut down trees (logging)
- Mine for rock or mineral resources
**Elementary level**
Class can work on this list together and perhaps narrow the topics to only one or two, such as camping or logging.

**Intermediate level**
Break class into quarters and assign each group one of the topics. Each group should create their list and present their findings to the class.

**Commencement level**
Assign each student one of the topics to research through books, magazines and the internet. After completing their research students with similar topics should team up to create a comprehensive list which will be presented to their classmates.

Bring your class lists and/or research with you on your visit. This will allow for a discussion of technology differences and similarities between today and 100 years ago.

**VISIT ACTIVITY**

**Skills Goals**
- Analyze human interactions with nature.

**Content Goals**
- Go on a simulated hike.
- Discuss popular Adirondack activities

**Learning Standards**
- MST 4 The Living Environment 4, 5 & 6

While touring Adirondack Hall consider yourselves on a hike through a mountain wilderness. Have a discussion about how you should behave in the woods. What challenges are there and can you be better prepared for them? How can seeing animal tracks or scat help you on your hike?

Teachers can also lead students in discussions on topics such as erosion, water quality, and plant and animal habitats. How can fun and healthy activities like hiking, canoeing or skiing affect the Adirondacks, in both positive and negative ways? What about activities like snowmobiling, mountain biking, motor biking or motor boating?

**POST VISIT ACTIVITY**

**Elementary level learners**

**Skills Goals**
- Discover the relationship between minerals and students everyday lives.
- View minerals as useful other than gemstones.

**Content Goals**
- Demonstrate common uses of minerals

**Learning Standards**
- MST 1 Analysis, Inquiry
- MST 5 Technology 2

Using the worksheet found at the end of this guide have students perform a treasure hunt through their homes or classroom to find at least one item made from the minerals listed on the sheet.
POST VISIT ACTIVITY
With adjustments for Intermediate to Commencement level learners.

Skills Goals
• Use mathematical computations associated with geometry.
• Determine approximately how many trees it took to frame a building, including a home.

Content Goals
• Geometry mathematics
• Usage of a renewable resource

Learning Standards
• MST 1 Analysis, Inquiry and Design
• MST 3
• MST The Living Environment 4.7

In the following activity students will be asked to complete mathematical computations to determine the board footage available within 5 random trees. Students are then provided with a construction industry estimate of the average number of board feet needed per square foot to frame a wooden-framed building. Using this data students can determine how many of “their” trees will need to be cut down to frame structures of varying sizes.

Part I
Begin by giving students the following data:
1. There are 5 trees to be cut down (height and diameters are fictional estimates). The trees measure as follows:
   a. 27 feet high, 17 inch diameter at 4.5 feet above ground
   b. 17 feet high, 12 inch diameter at 4.5 feet above ground
   c. 21 feet high, 12 inch diameter at 4.5 feet above ground
   d. 46 feet high, 29 inch diameter at 4.5 feet above ground
   e. 55 feet high, 30 inch diameter at 4.5 feet above ground

2. Divide the diameter of each tree by 2 to determine its radius.

3. Take the resulting radius and divide by 12 to convert inches into feet.

4. Use the following formulas in order determine the number of board feet for each tree:
   a. \( \pi \times (\text{Radius divided by 12})^2 \) = Area at 4.5 feet above ground
   b. Area x tree height = Volume of the tree
   c. Volume of tree / 4 = Cubic feet of lumber in each tree
      (Division by 4 accounts for trunk width at bottom and narrowness at top)
   d. Cubic feet of lumber \times 12 = board feet in each tree

5. Add up all 5 tree results and divide by 5 to get an average number of board feet for their trees.

Intermediate level learners
This exercise can be simplified by giving the students data that they have 5 trees that have an average of 300 board feet of lumber in each tree. Then proceed to the next part.
Commencement Level learners
Using a clinometer, and a tape measure students can go outside to choose and measure their own trees. Students should be encouraged to choose between 5 and 10 trees of the same type where the trunk is at least 16 feet tall.

Part II
Estimates vary, but using the following information on building sizes and board feet have each student determine the number of their “average” trees needed to frame the structures listed.

1. 1000ft² building = 6,300 board feet approximately
2. 1500ft² building = 9,450 board feet approximately
3. 2000ft² building = 12,600 board feet approximately

These numbers are based upon an estimate of roughly 6.3 board feet per square foot. Different sources will estimate the number of board feet per foot² differently, so this should be considered to be just an estimate.

Have students find out the number of square feet in the building they live in and how many trees it may have taken to frame that structure.

Topics for further discussion are:
- Not every building is framed with wood. What other resources might be used?
- The trees represented are only to frame the building and not figured in are other possible items made of wood like doors, sheathing, floors, siding, cabinets, etc...
- Buildings that house more people (apartment buildings, duplexes) may use more trees, but they do it more efficiently.
- Different types of wood serve different purposes. Pine is most often used in construction. Maple and oak more often are used in furniture and cabinetry.

Below are some websites that were used to create this exercise.

Glossary

**American Marten**  Mammal, larger member of weasel family, but smaller than the fisher.

**Clinometer**  Device for measuring an angle of elevation or incline.

**Fisher**  One of the largest members of the weasel family. Smaller than a wolverine.

**Geology**  The study of the earth.

**Local Extinction**  None of a species living in a particular area, but living elsewhere.

**Mammal**  Any of a class (Mammalia) of warm blooded animals, with hair or fur, have live births and nurse their young.

**Matrix**  Something within or from which something else originates, develops, or takes form.

**Mineral**  A solid, consistent, crystalline element or compound that results from the inorganic processes of nature.

**Ore**  A mineral or mineral containing rock which is mined or processed for it’s economic value.

**Portage**  The carrying of boats and supplies overland between two waterways or around an obstacle to navigation.

**Species**  A class of individuals or objects grouped by virtue of their common attributes and assigned a common name, a division subordinate to a genus.

**Sojourn**  Reside temporarily. A brief stay.

Hunt around your home or classroom to find everyday items made from minerals.

Many of these minerals are mined in New York State.

Try to find and write at least one thing in each box that is made from that mineral. There are clues to help you.
