Description of Map Units

Holocene Alluvium (Af)

Non-glacially derived, hard rock, pre-pleistocene in age. Might be a cover over a meter of sand and gravel, or sand and clay.

Lake sedimentary deposits, including the proglacial sediments found in the northeastern section of the quadrangle. These deposits are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Lake sediments are present in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Alluvial sediments are found in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Lake sediments are present in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Alluvial sediments are found in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Lake sediments are present in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Alluvial sediments are found in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Lake sediments are present in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Alluvial sediments are found in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Lake sediments are present in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Alluvial sediments are found in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Lake sediments are present in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Alluvial sediments are found in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Lake sediments are present in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Alluvial sediments are found in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Lake sediments are present in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Alluvial sediments are found in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Lake sediments are present in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Alluvial sediments are found in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Lake sediments are present in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Alluvial sediments are found in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.

Lake sediments are present in the northeastern section of the quadrangle. These sediments are composed of gravel, sand, silt, and clays. The sediments are often associated with organic matter and may contain plant material.
