DRIFT THICKNESS OF New York State Geological Survey Dr. Andrew L. Kozlowski, Director New York State Museum Mark Schaming, Director SENECA COUNTY, NEW YORK Karl J. Backhaus Wayne 2023 Introduction Beginning in 2019, under the guidance and funding provided by the United States Geological Survey - Great Lakes Geological Mapping Coalition (award G20AC00401), the New York State Museum - Geological Survey began a statewide effort to conduct geologic mapping of bedrock elevations throughout New York. Seneca County, of central New York, extends from the Erie-Ontario Lowlands to the Allegheny Plateau physiographic provinces. The county is nestled between Cayuga, Ontario, Schuyler, Tompkins and Wayne counties. Seneca County is also located along two large bodies of water, Cayuga and Seneca Lake. Surficial and subsurface bedrock point data and maps were compiled from publicly available sources, vetted, and organized into a comprehensive geospatial database. A technical workflow was developed to categorize the overall geology and differentiate between the underlying bedrock and overlying unconsolidated sediments. The resulting bedrock elevation map provides a detailed representation of bedrock topography across Seneca County. This map is useful for various applications, including geological studies, engineering and construction, natural resource management (such as water or mineral resources), and environmental studies. Methodology A total of 999 bedrock control points were used to delineate bedrock topography in Seneca County. These points consist of 936 water wells, 21 waterfall locations, 20 engineering boreholes, 20 known bedrock outcrops and two exploratory boreholes. These data were compiled from a variety of public sources and imported into ESRI's ArcMap 10.8 software platform. Ground surface elevations for all control points were extracted from a compilation of three separate digital elevation models (DEM) which were resampled to match a 1-meter LIDAR DEM cell size. Bedrock elevations were calculated at each location by subtracting the depth-to-bedrock from the ground surface elevation. 50-foot bedrock elevation contours were auto-generated and manually refined through a multi-step quality control process to resolve any interpolation errors. The finalized contours were converted into a 1-meter raster, using the "Topo to Raster" tool, that represents county-wide bedrock topography. Lastly, the "Raster Calculator" tool is used to subtract the surface elevation from the bedrock elevation to determine the thickness of the drift in the county. Cayuga Summary The New York State Museum – Geological Survey has developed a detailed Drift Thickness Map for Seneca County. This map represents a compilation of various surficial and subsurface bedrock data sources, analytical methods, and quality control procedures. The resulting bedrock elevations reveal a range of distinct geological features including a variety of Paleozoic bedrock erosional profiles, and evidence of past glaciation. These characteristics are likely the result of a variety of functions including bedrock stratigraphy, structural deformation, and erosional processes such as past glaciation and fluvial geomorphology. This map is significant for applications in geological research, engineering, natural resource management, and environmental studies. Continued research and work on subsurface geology will provide additional data and insight and enhance the geologic framework of bedrock geology throughout New York State. **Explanation Data Point** Highway Seneca County Line **COUNTY LOCATION** Water Body **Drift Thickness Feet Thick** 0 - 10 10 - 20 20 - 30 **Yates** 30 - 40 40 - 50 **Tompkins** 50 - 60 60 - 70 70 - 80 80 - 90 90 - 100 100 - 150 **Tompkins** 150 - 200 Schuyler

nis geologic map was funded in part by the USGS National Cooperative Geologic Mapping Program STATEMAP award number G20AC00418 in the year 2021
