Introduction
Beginning in 2019, under the guidance and funding provided by the United States Geological Survey - Great Lakes Geological Mapping Coalition (award G20AC204040), the New York State Museum - Geological Survey began a statewide effort to conduct geologic mapping of bedrock elevations throughout New York. Steuben County, of southwestern New York, is in the Alleghany Plateau physiographic province. The county is nestled between Allegany, Livingston, Ontario, Yates, Schuyler, and Chemung Counties with Pennsylvania to the south. Steuben County is also located along one large body of water, Keuka Lake. Surficial and subsurface bedrock point data and maps were compiled from publicly available sources, vetted, and organized into a comprehensive geospatial database. A technical workflow was developed to categorize the overall geology and differentiate between the underlying bedrock and overlying unconsolidated sediments. The resulting bedrock elevation map provides a detailed representation of bedrock topography across Steuben County. This map is useful for various applications, including geological studies, engineering and construction, natural resource management (such as water or mineral resources), and environmental studies.

Methodology
A total of 3,947 bedrock control points were used to delineate bedrock topography in Steuben County. These points consisted of 2,556 water wells, 167 thawway engineering boreholes, 1,171 bedrock outcrops, 49 waterfall locations and 14 oil and gas wells. These data were compiled from a variety of public sources and imported into ESRI’s ArcMap 10.8 software platform. Ground surface elevations for all control points were extracted from a compilation of three separate digital elevation models (DEMs) which were resampled to match a 1-meter LIDAR DEM cell size. Bedrock elevations were calculated at each location by subtracting the depth-to-bedrock from the ground surface elevation. Fifty-foot bedrock elevation contours were auto-generated and manually refined through a multi-step quality control process to resolve any interpolation errors. The finalized contours were converted into a 1-meter raster, using the “Topo to Raster” tool, that represents county-wide bedrock topography.

Explanation

- **Data Used**
  - Surficial and subsurface bedrock data sources
  - Analytical and quality control procedures

- **Resulting Characteristics**
  - Range of distinct geological features
  - Paleozoic bedrock erosional profiles
  - Evidence of past glaciation

Summary
The New York State Museum – Geological Survey has developed a detailed Bedrock Topography Map for Steuben County. This map represents a compilation of various surficial and subsurface bedrock data sources, analytical methods, and quality control procedures. The resulting bedrock elevations reveal a range of distinct geological features including a variety of Paleozoic bedrock erosional profiles, and evidence of past glaciation and fluvial geomorphology. This map is significant for applications in geological research, engineering, natural resource management, and environmental studies. Continued research and work on subsurface geology will provide additional data and insight and enhance the geologic framework of bedrock geology throughout New York State.
